Data and outlook as of March 31

Mike McGlone – BI Senior Commodity Strategist

[BI COMD](#) (the commodity dashboard)

Commodity-Recovery Foundation Solidifying vs. Extended Equities

Performance: March +0.2%, 2019 +6.3%, Spot +7.4%.
 (Returns are total return (TR) unless noted)

(Bloomberg Intelligence) -- All risk assets are subject to sharp stock-market declines, but we expect commodities' favorable reward vs. risk profile to continue improving. Futures' increasing expectation of Federal Reserve easing leaves a final pillar of dollar support -- U.S. vs. global equity outperformance. Commodity risks center on West Texas Intermediate crude oil and its increasing correlation to the S&P 500. Limited upside to above 2,800 in the latter indicates a WTI revisit of \$50 a barrel. Metals should continue to shine in most scenarios, as the end of U.S. equities outpacing global stocks would be a primary dollar headwind.

Sentiment about the Corn Belt's risk of production cuts in early growing season has rarely been this complacent, elevating the prospect of higher prices. Our updated quarterly analysis indicates early commodity recovery.

Favored Vs. Wobbly Stocks

Commodities Enter Favorable Recovery Zone vs. Primary Companions. Just a little mean reversion in primary broad-commodity companions -- China's purchasing managers' index and the dollar -- should have an outsized positive effect on prices. Reward vs. risk for commodities is favorable, notably vs. U.S. equities. If stocks decline, it's a dollar headwind and favors commodity bulls.

Long-Term Commodity Drivers Turn Higher. Limited upside in the dollar and downside in China's PMI support acceleration of the nascent bull market in commodities. Our graphic depicts the 20-quarter average of the Bloomberg Commodity Spot Index in early days of a

bear-to-bull transition vs. the lowest quarter-end PMI level in a decade and a potential peak in the trade-weighted broad dollar from the 16-year high in 4Q. Indications from these top companions could get worse for commodities, but the longer-term mean-reversion potential appears to be more significant from such extremes.

China PMI & the Dollar, Prime for Mean Reversion

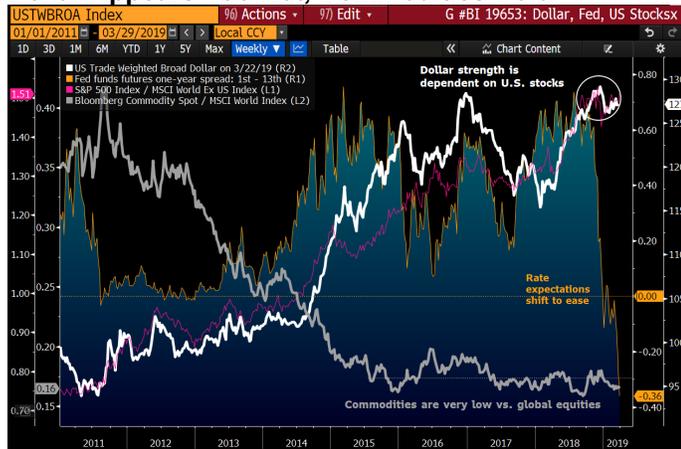

In the history of the PMI since 2004, the annual correlation of the Bloomberg Commodity Index is about 0.70 vs. about a minus 0.70 reading to the dollar.

Dollar Hanging By a Thread Is Commodity Pillar. A commodities recovery is highly dependent on a peak dollar, as greenback reversion to a lower mean is more probable than its appreciation potential, in our view. In addition, the S&P 500 is unlikely to continue to double the MSCI World Excluding U.S. Index's return, as it has since 2010. U.S. equity-market outperformance is a final dollar-support pillar following the shift to easing in the fed funds' one-year futures spread.

Bloomberg Commodity Outlook – April 2019 Edition

Bloomberg Commodity Index (BCOM)

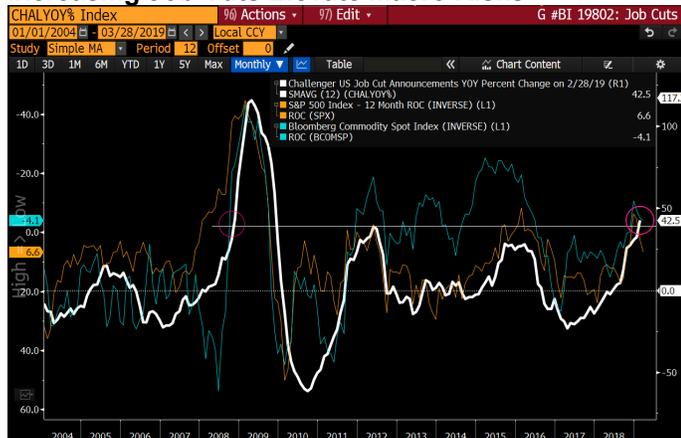

Dollar Appears Too Hot, Commodities Cold

Our graphic depicts potential early reversion in the strong-dollar trend. Flat for the fourth year, the ratio of the Bloomberg Commodity Spot Index vs. MSCI World gauge should be a primary beneficiary of a dollar peak. In the past 20 years measured annually, the dollar has a positive 0.73 correlation to the S&P 500 vs. World ratio, and as negative a number vs. the Bloomberg Commodity Index (BCOM).

U.S. Job Cuts at 10-Year High Is Macro-Negative for Commodities. A shift to the highest 12-month average in Challenger job-cut announcements in a decade, a key macroeconomic indicator, has negative implications for commodities. Our graphic depicts the strong inverse relationship between job cuts vs. the S&P 500 and, to a lesser extent, the Bloomberg Commodity Spot Index. Indicating an extreme disparity that's at risk of narrowing, the unemployment rate in November 2008 was 7% when cuts were at the same level in a similar upward trajectory. It's now 4%.

Increasing Job Cuts Elevate Macro Risks

A low unemployment rate should soften the blow of job reductions, but the risks are clear. A continuation of last year's stock-market swoon is a primary risk for

commodities, notably crude oil and copper. Weak U.S. equities should pressure the dollar, which is a commodity tailwind, particularly for gold.

MACRO PERFORMANCE

Elevated Risk for Top Macro Performer Crude Oil. The dollar at the bottom of the macro performers is more likely to be sustained when U.S. stocks stop outperforming global equities, which is broad-commodity supportive. Crude oil ending 1Q up about 30% remains a primary commodity-market risk factor, particularly if the sharp stock-market recovery reverses. This unique dynamic supports a favorable risk-to-reward profile in broad commodities vs. equities. Up about 13% in 1Q, the S&P 500 has had a good year, but it's vulnerable near good resistance at 2,800, with many indicators flashing warning signals.

Crude Oil Is Vulnerable With Wobbly Equities

Security	Chg YTD %	Chg March	Chg QTD	Chg Pct	1Yr % Chg	2Yr % Chg
Generic 1st 'CL' Future	+32.4%	+5.1%	+32.4%	-7.4%	21.5%

Bloomberg Dollar Spot	+2%	+7%	+2%	+6.5%	-1.7%	
US Trade Wgt Broad Dollar Indx	-6%	+4%	-6%	+7.6%	2.4%	

We expect last year's strong dollar performance to have marked a last gasp for the bull market, and for the greenback to remain near the bottom of 2019 performers, which is primarily supportive of metals.

SECTOR PERFORMANCE

Weak Grains Set to Trade Places With Strong Energy.

The best-performing sector (energy), and the worst (grains), have elevated potential of reversal, at least in 2Q, in our view. A historically low Corn Belt growing-season production-risk premium lifts prospects for grain prices, which often peak in 2Q. Progress on a U.S.-China trade deal is additional support. Crude oil -- the primary energy driver -- is quite vulnerable with WTI potentially backing away from good resistance near \$60 a barrel, and with the S&P 500 at 2,800.

Precious metals should continue to mark time with the dollar, both ending 1Q about unchanged. The metals sector appears to have the most favorable reward vs. risk

Bloomberg Commodity Outlook – April 2019 Edition

Bloomberg Commodity Index (BCOM)

profile in most scenarios. Industrial metals are well-supported with the stock market, but if volatility continues to increase, it'll be a dollar headwind.

Energy Bears Gaining Favor

WTI Crude Oil Is More Vulnerable to Revisiting \$50 Than \$70. Consistent with past trends, responsive sellers are likelier to prevail in an oversupplied crude-oil market, pressuring 2Q prices, in our view. West Texas Intermediate, the most significant benchmark in the production paradigm, seems as vulnerable near \$60 a barrel at the end of 1Q as it was favored for recovery when priced at \$45 in 4Q.

Oversupplied Conditions Favor Responsive Sellers. WTI crude oil is vulnerable to revisit \$50-a-barrel support, in our view, with the wobbling stock market an increasing headwind. Since 4Q15, the quarterly WTI-to-S&P 500 correlation has increased toward 0.70, more than double the level of the past 20 years. The primary reason for the 30% gain in 2019 is that crude oil ended 4Q near good support at \$45 a barrel as the S&P 500 met 2,400. Recovering to \$60 a barrel in 1Q with the S&P 500 at 2,800 leaves crude oil highly prone to equities backing away.

Our graphic, which shows crude oil revisiting its downward-sloping 20-quarter average in 1Q, suggests it shouldn't take much for WTI to retreat. Production cuts -- the primary focus of OPEC and Russia -- are indicative of our primary concern -- oversupply.

Crude Oil Should Remain a 'Sell Rallies' Market

Crude-Oil Bulls to the S&P 500 Index -- We Need You Above 2,800. There's little room for further appreciation in crude oil, absent similar in the stock market, in our view. Key lines in the sand have been reached. In the S&P 500, about 2,800 was the last gasp before the December plunge as the Fed hiked interest rates, possible for the last time. On the way down in November, it was the rapid breach of then-\$60-a-barrel support in West Texas Intermediate that indicated macro risk-off. Now resistance, it's unlikely WTI can sustain above \$60 without the S&P 500 doing the same, above 2,800.

WTI Likely to See \$50 If S&P 500 Holds Resistance

An oversupplied market, temporarily supported by production cuts from Saudi Arabia and Russia and U.S. sanctions on Iran and Venezuela, crude oil is vulnerable to further declines. On a 20-week basis, the WTI-to-S&P 500 correlation is 0.67, about double that of the annual measure in the past 20 years.

Unleaded Gas at Risk of Responsive Selling. What was well-supported in December-January now appears near resistance. We believe unleaded gasoline, the top-performing major commodity so far this year, is

Bloomberg Commodity Outlook – April 2019 Edition

Bloomberg Commodity Index (BCOM)

vulnerable to mean reversion. Up over 40% to March 29, the front unleaded gas future (RBOB) has returned to its downward-sloping 52-week average and is near the upper end of its range vs. West Texas Intermediate (WTI). The sharp -- and suspect -- V-shaped recovery from December's oversold condition is most pronounced in the gasoline-to-WTI crack spread.

Unleaded Gas Has Swiftly Shifted Into a Sell Zone

Now close to 19, the NYMEX RBOB-WTI crack bottomed at a nine-year low (4) in January, but further upside is limited. Since the crude-oil bull market began in early 2016, 25 has held resistance. The inverted, P-shaped gasoline-price pattern since 2014 emphasizes the bearish overtone.

EM Crude-Oil Price Support Is Diminishing. Crude-oil prices are showing diminishing returns vs. emerging-market equities. An example of the declining price support from EM equities is that the MSCI Emerging Markets Index is at about the same level it was in August, when Brent crude was near \$80 a barrel, and 2012-13, when it was \$110 a barrel, yet Brent was only \$68 a barrel on March 29. Last year, EM was more of a leading indicator for crude oil -- its peak in January, coinciding with a near-term high in Brent near \$71, should mark good resistance.

Changing demographics and rapidly advancing technology have shifted most crude-oil incremental demand from developed countries to EM. Crude oil is 0.70 correlated to the MSCI Emerging Markets Index on a 20-year annual basis, which is about the same to International Energy Agency global demand vs. supply estimates.

Crude Oil Divergent Weakness to EM Equities

It's Been a Good Year Already in Crude Oil. Crude oil will remain under pressure, we believe, with unfavorable demand vs. supply conditions keeping a lid on prices. WTI's sharp recovery to a high of \$60.73 a barrel is at a steep risk of marking the 2019 peak. Sustained supply reductions from OPEC and Russia should be necessary to support a market that's clearly at a surplus, based on our analysis of IEA and EIA data.

WTI Crude Oil Has Limited Upside Near \$60

Led by surging U.S. and Canadian production and declining additional demand, the trend in energy prices is down. The 2018 rally that resulted in an average WTI price of \$63.66 appears similar to 2011, when the average per-barrel price was \$95.08. At about \$60 on March 29, there's plenty of incentive for strong North American production.

U.S. Fuel Production to Overtake Consumption.

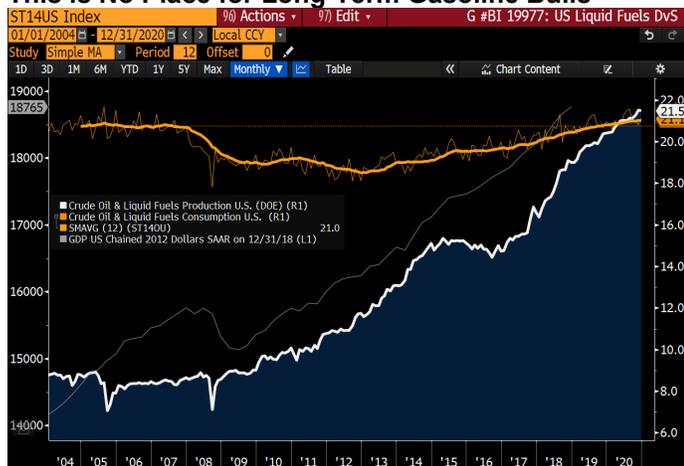

Rapidly increasing U.S. fuel production vs. flat consumption indicates an unleaded-gas market that should struggle to maintain rallies, in our view. Seemingly unstoppable U.S. crude oil and liquid fuels output is facing off against almost stagnant domestic consumption,

Bloomberg Commodity Outlook – April 2019 Edition

Bloomberg Commodity Index (BCOM)

despite increasing GDP. In addition, the trend from the Department of Energy is revising production estimates higher, with current projections for output to exceed consumption in about a year.

This is No Place for Long-Term Gasoline Bulls

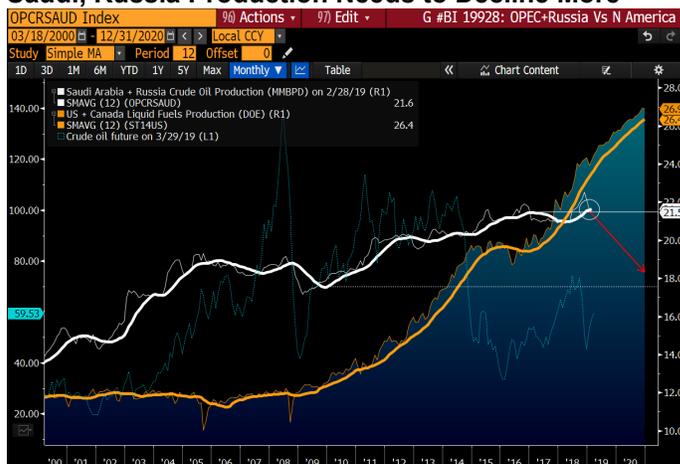

Since the end of 2007, consumption of U.S. crude oil and liquid fuels is flat despite an almost-20% increase in GDP, while production has more than doubled, with biofuels playing a big part. President Donald Trump last year announced that 10% ethanol (E10) blended in gasoline will be bumped to E15.

Saudi Arabia, Russia Crude Cuts Insufficient.

Production from the largest crude-oil producers, Saudi Arabia and Russia, will likely need to decline much more and stay down to offset rapidly increasing U.S. and Canada liquid-fuels supply. On a 12-month basis, Saudi Arabia and Russia crude production is the highest ever, based on our analysis of Bloomberg and Energy Intelligence Group data. Recent cuts have basically reduced last year's excess. Our graphic indicates Saudi and Russian production will need to decline to near 2009 levels in the coming years to offset increasing North American production.

In 2014, Saudi and Russian production averaged almost 20.5 million barrels per day (Mbpd) vs. 18.5 for the U.S. and Canada. DOE estimates put U.S. and Canada production about 9 mbpd higher at 2020-end, yet Saudi and Russian current production is 1 mbpd above 2014.

Saudi, Russia Production Needs to Decline More

PERFORMANCE DRIVERS

Energy Downside Risks Outweigh Upside Potential.

WTI crude oil's 43% rally from 2018's low to 2019's peak is about as good as its price will get this year. Absent unexpected geopolitical issues, we believe WTI needs additional support from a rallying stock market to sustain above \$60, a level that marked the halfway point of 4Q's plunge. OPEC and Russia production cuts have helped stabilize the market, but sustainable reductions should be necessary to offset North American supply, slowing global growth and increasing volatility in equities. Timing vs. the 2018 bottom (at year-end) is a primary reason for the 30% Bloomberg WTI Crude Oil Subindex total return in 1Q.

Further Energy Sector Returns Should Be Limited

Security	Chg YTD %	Chg March	Chg QTD Pct	1Yr % Chg	2Yr % Chg

Two Markets, Both Gaining Favor

A Tale of Two Metals Markets Favors Both Industrial, Precious. Industrial metals will stay atop the leader board with a recovering stock market, yet we see overall metals as well-positioned when U.S. equities stop outperforming the rest of the world. This dynamic shines longer-term favor on the Bloomberg All Metals Index as a lofty dollar is the primary remaining headwind, particularly for precious metals. With futures priced for Federal Reserve easing, healthy U.S. stocks are the final pillar of support for the dollar. Gold-pressure factors at the end of 1Q -- the bursting palladium bubble and declining stock-market volatility -- should be temporary.

Our quarterly analysis shows industrial and precious metals in the early days of recovery. Palladium's rally is done, potentially in a similar fashion as in 2001 when it peaked close to \$1,100 an ounce, a likely first target for support.

Base Metals Making Turn Higher

Industrial Metals Making the Turn Higher Despite a Strong Dollar. The end of 1Q leaves industrial metals in a favorable position, in our view, particularly vs. the still-strong dollar and the U.S. stock market. The 20-quarter average of the Bloomberg Industrial Metals Spot Subindex looks similar to the 2003 bear-to-bull shift.

Industrial Metals Bull: A Refreshing Dip. Industrial metals are showing divergent strength, making a turn higher on a quarterly basis despite the strong dollar. Our graphic depicts the 20-quarter average of the Bloomberg Industrial Metals Spot Subindex looking a lot like 2003's bear-to-bull transition with a peak greenback. A key difference is the trade-weighted broad dollar topped in 2002. If the greenback is peaking, it's only been one quarter, yet metals have held above the 20-quarter average since 3Q17.

Base Metals Bull, Not Waiting for a Weak Dollar

Industrial metals are 0.68 negatively correlated to the dollar, about the same as the positive relationship to the Bloomberg Commodity Index, as measured annually over the past 20 years.

Copper Bull Just Waiting on a Peak Greenback.

Copper is poised to outperform the S&P 500, notably if the greenback breaches support, which is primarily underpinned by U.S. equities in our view. Up about the same -- 40% -- in this rate hike cycle, the nascent copper bull appears in a better risk vs. reward position than the extended S&P 500 total return. A key indicator is the Bloomberg Dollar Index -- it has returned to initial support near its 52-week mean. If the greenback breaches support, copper and the metals, notably gold, should be primary beneficiaries.

Copper Set to Take Bull Baton From U.S. Stocks

Copper typically suffers when equities decline, but would gain buoyancy from a weaker greenback. With the Federal Reserve shifting away from further hikes, a prime catalyst for dollar weakness is a decline in the U.S. stock

Bloomberg Commodity Outlook – April 2019 Edition

Bloomberg Commodity Index (BCOM)

market. It's basically a last dollar pillar with futures markets priced for rate cuts.

Plenty of Support for Copper Prices. Copper has a strong foundation for further price gains, in our view. Six months of consolidation from August to January provides a strong base, centered around \$2.72 a pound vs. \$2.94 on March 29, with its key companions pointing favorably. Mean-reversion potential in a top copper companion -- China's purchasing managers' index (PMI), which is near a decade low -- far outweighs downside risks. Similar conditions exist in the trade-weighted broad dollar, a leading negatively correlated companion. Dollar-mean-reversion risks from the 16-year high at the end of 2018 outweigh appreciation potential.

Copper Appears as a Discount in Uptrend

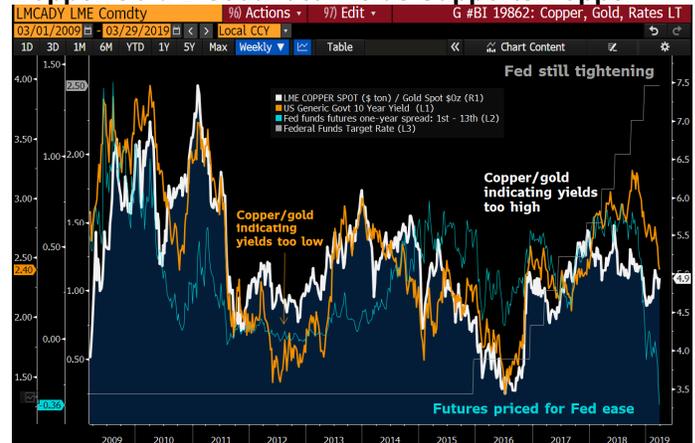

Copper's recovery above its 12-month average near \$2.84 in February appears to be anticipating companion support. Copper is 0.92 correlated to China PMI and minus 0.70 to the dollar, measured annually in the past 20 years.

Narrowing the Yield Gap Favors Copper. The greatest disparity in the copper-to-gold ratio vs. 10-year Treasury yields in six years supports higher copper prices, in our view. In 2012, copper-to-gold didn't decline as the 10-year yield dipped to 1.39%; they both peaked as the yield recovered toward 1.69% by December 2013. Declining copper-to-gold last year indicated the rally to 3.24% was too extreme. Continuing to narrow the gap between the highly correlated measures supports higher copper prices. A key disparity now is that futures are priced for Fed easing despite the rate-hike trend.

With 260-day volatility in copper about double that of gold, copper has been the primary driver of the ratio between the metals. Risks of reversal in the relationship driver are elevated though, with gold volatility about the lowest in two decades.

Copper/Gold Discount to Yields Supports Copper

Precious Metals Still Resting

Gold's Lack of a Pulse Indicates a Longer Nap Until Peak Dollar. Stuck close to \$1,300 an ounce in 1Q, gold is set to head for resistance at \$1,400 instead of continuing to consolidate and revisit \$1,200. It's been six years since gold traded above \$1,400 vs. just a few months ago when it was below \$1,200, yet headwinds are dropping fast, with a lofty dollar the primary remaining holdout.

Gold Marking Time in 1Q Favors 2Q. Gold looks similar to 2002, when it shifted to a bull market as the dollar peaked. Our graphic depicts the metal showing comfort above its 20-quarter average as the gauge appears to be turning from bear to bull. A peak in the trade-weighted broad dollar should seal a gold recovery, more so than in 2017. Then, stock-market volatility was still declining toward multidecade lows while rates and yields were on the rise. The opposite conditions are in place now, with a strong dollar the final pillar for gold.

Gold Making Bull Turn vs. Dollar Opposite

Bloomberg Commodity Outlook – April 2019 Edition

Bloomberg Commodity Index (BCOM)

The dollar's final base of support is the U.S. stock-market outperformance vs. the rest of the world.

Gold Is Set to Breach Resistance. Gold is warming to breach the upper end of its caged range. A primary difference this time vs. past failures is that futures have shifted to expectations of a Fed easing in the aftermath 2018's failed gold-bear raid. Managed-money positions on CME-traded gold futures reached the most net short in October, as a percentage of open interest in the database since 2006. In an environment of historically low volatility, such an extreme is a prime candidate for forming a longer-term price bottom. Seemingly unstoppable exchange-traded fund (ETF) inflows indicate endorsement of higher prices.

Top-of-the-Cage Resistance May Be Short Term

In this the rate-hike cycle, gold ETF holdings have increased 55% (in ounces) vs. just 22% for the spot price. Gold ETF holdings are 0.84 correlated to the price the past 10 years measured annually.

Gold Time Correction Favors Rally Resumption. The unlikely is necessary for gold not to resume the rally it began about two decades ago, in our view. Gold is in a similar extreme coiled-spring condition as in 1997, but with the dollar at multiyear highs such as in 2002. Unless the greenback can manage further appreciation, gold should, which is what we expect. Dollar mean-reversion risks outweigh potential further upside, notably as rate-hike expectations have shifted to ease in the futures market.

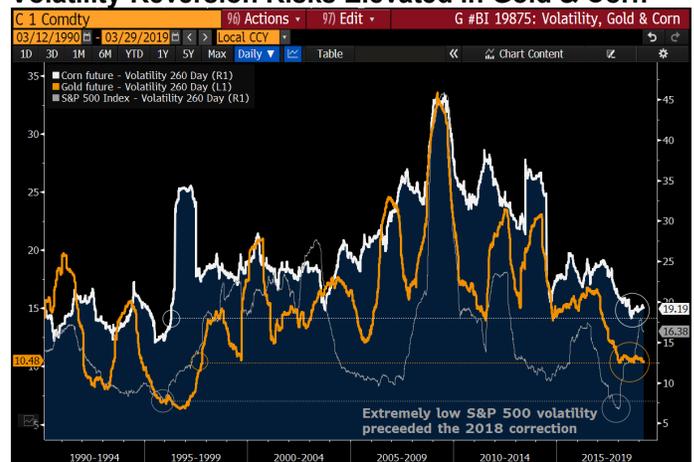

The narrowest for longest gold 60-month Bollinger Bands since 1997 is an indication of how compressed the market is and of potential fuel for a breakout. Unchanged since June 2013, gold's sixth year of consolidation can be considered an extended time correction of the bull market since 2002.

Well Rested Gold Bull Just Waiting on the Dollar

Explosion Risks Elevated in Gold and Corn. Market volatility can stay low for extended periods but eventually reach such an extreme level of complacency that minor catalysts can spark big moves, and gold and corn are prime candidates. Our graphic depicts the lowest-for-longest 260-day volatility since 1997 for gold and 1996 for corn. Similar conditions for the S&P 500 at the beginning of 2018 resulted in the most significant correction (20%) in seven years. In 2017, the narrowest natural gas annual range since futures began trading in 1989 led to a 41% spike in November 2018.

Volatility-Reversion Risks Elevated in Gold & Corn

These sharp negative gamma-related moves from 2018 have fully reversed, after flushing plenty of weak positions. Traders, options positions and algorithms can become complacent selling rallies and calls, as in natural gas, or puts, as in equities, in low- and declining-volatility environments.

Metals Bull Getting Game On With Fed Catch-Up.

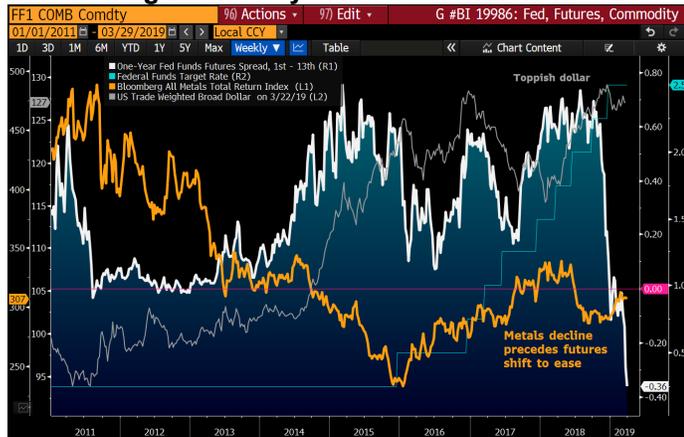

Precious metals are set to be primary beneficiaries of the Fed catching up to futures expectations for easing. The dollar is a primary connection. Likely in the early days of

Bloomberg Commodity Outlook – April 2019 Edition

Bloomberg Commodity Index (BCOM)

backing away from 2018's 16-year high, the trade-weighted measure, which rallied 20% in the two-year run-up to the first rate hike this cycle, has plenty of mean-reversion room. It's unlikely a coincidence that the dollar peaked with the Dec. 19 interest-rate increase. A week later, futures indicated easing would be the next move.

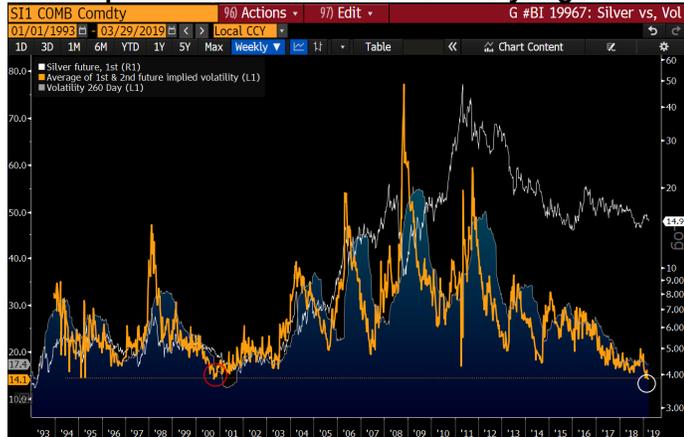

Diminishing Dichotomy - Rate Hikes vs. Market Ease

To shift back to hikes, strong indications of inflation are required, which should be led by higher industrial-metals prices. If futures are right and rate cuts are next, a peak dollar is likelier, supporting gold and precious metals. The correlation between metals and the dollar is one of the most negative.

Silver-Options Complacency as Low as It Gets. Priced for the least amount of movement in futures options history, the risk of a silver-price surge is elevated, in our view. Our graphic depicts the lowest-for-longest implied volatility since 1993. The trend in prices and volatility has been down, but at such extremes, the risks of a potential sharp reversal and longer-term bottom outweigh the continuing rewards for responsive sellers of the market and calls. When commodities reach such extremes, up is typically the path of least resistance.

Short Options Premium Risks Are Rarely Higher

Options-implied volatility reflects the premium for price optionality in the underlying futures. Call-premium sellers have been the primary beneficiaries for about eight years. Conditions that have resulted in historically low volatility typically need to end to reverse the trend.

Silver-Bull Options Improving on Copper, Gold.

Gold and copper showing comfort above widely watched resistance levels leaves little room for silver to go but higher, if history is a guide. The quasi-currency, often considered "leveraged gold" and that's produced mostly as a byproduct of other metals (yet is over 50% used industrially), is often guided by its primary companions. Recoveries in gold and copper indicate silver is ripe to breach 100-week average resistance for the first time in over a year. An additional foundation is 2018's failed bear raid.

Silver Ripening to Breach 100-Week Resistance

Silver is 0.77 correlated to gold and 0.71 to copper in the past 20 years, measured annually. Silver's beta to both metals is about 1.4. Indicating the extent of complacency, silver exchange-traded-fund holdings (in ounces) are up about 5% since the start of the current rate-hike cycle, vs. 56% for gold.

Silver Downside vs. Gold Is Limited.

Silver, the primary driver of its ratio vs. gold, is set to prevail, with the relationship potentially peaking from a 25-year high. With annual volatility that's almost double gold's, silver is 0.78 negatively correlated to the ratio vs. only 0.08 for gold, measured annually. Our graphic depicts the limited room for silver to decline vs. gold, with the ratio at levels last seen in 1993. The mean figure since then is about 65, vs. the current 85 ounces of silver per one of gold.

With gold unchanged, revisiting the mean would imply a silver price near \$20 an ounce vs. \$15.50 on March 20, about a 30% advance. A peak in the dollar is a potential catalyst for boosting silver vs. gold. Commodities often find demand and less supply when prices are low, and vice versa when they're relatively high.

Mean-Reversion Risks Favor Silver vs. Gold

PERFORMANCE DRIVERS

Metals Gaining Reward vs. Risk to Stock Market. Top performers in 1Q, industrial metals are vulnerable to an extended stock market, but the broad metals sector is poised to outperform, in our view. The dollar is the primary connection and is supported by dominant U.S. equities. Once that ends, tailwinds should pick up for metals, the most negatively dollar-correlated commodity sector. The Bloomberg All Metals Total Return close to 7% in 1Q has a good foundation, especially if the 2018 dollar rally was the last gasp.

Strong Base Metals Gain Support When Peak Dollar

Security	Chg YTD %	Chg March	Chg QTD	1Yr %	2Yr %

Gold and silver are best positioned to recover when the dollar peaks, notably silver as primary companion copper appears to be in a nascent bull market. Nickel and zinc, more closely associated with increasing demand from rapidly advancing technology, complete the remaining notch of our favorable metal bias.

Agriculture (Index weight: 30% of BCOM)

Softs (Weight: 6% of BCOM)
 Performance: March -0.7%, 2019 +0.4, Spot +0.8%)

Elevated Complacency Risks

Complacency Over Unusual Run of High Yields Supports Ag Prices. Elevated net-short positions and historically low Corn Belt production-season risk premiums support short-term prices, adding to indications of a longer-term bottom in agriculture, in our view. The lowest implied volatility in grain options in our 25-year database indicates the level of complacency in continuing a trend of record-setting yields. Absent the most favorable growing conditions, 2018's grain-price recovery should accelerate. Mean-reversion risks in the elevated dollar and stocks-to-use favor price appreciation vs. further downside.

Swine flu is supporting livestock and indicative of normalization risks in strong production trends in agriculture and mean-reversion risks in pricing. Top-performing lean hogs have recovered some lost ground as the grains await U.S.-China trade negotiations.

Ripening Grain Rally Risks

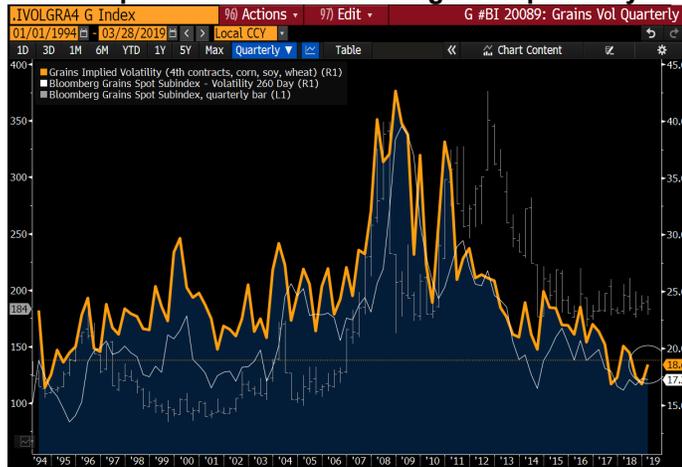

What, Me Worry? Extreme Complacency Is Grain-Price Supportive. It's prudent to be cautious when markets are priced for very little risk (as happened at the end of 3Q), which is grain-price supportive. Historically compressed pricing, very low options prices, record corn shorts and limited further pressure from stocks-to-use and the Brazilian real greet the Corn Belt sowing season.

Extreme Production Complacency Raises Rally Risks. The least amount of Corn Belt planting-season risk premium in the market in 25 years elevates the prospect of grain-price upside, in our view. Since 1994, our measure of the average of options-implied volatility for the fourth contracts for corn, soybeans and wheat has never been lower at the end of March. It's about 19% vs. 20% a year ago and the previous low (19.8%) at the end of 1Q95. A primary difference from the latter is 260-day actual volatility on the Bloomberg Grains Subindex was near 16% vs. 17.5% now.

Bloomberg Commodity Outlook – April 2019 Edition

Bloomberg Commodity Index (BCOM)

Buried Options Prices Indicate High Complacency

Actual market volatility is higher than in 1995, though still historically low. Yet the cost of price-movement insurance, as measured by options volatility, is the lowest ever. The grains rallied more than 70% from 1Q95 to the peak in 2Q96.

Grains' Coiled-Spring Risks Favor the Upside. Mean-reversion risks in primary grain-price drivers elevate the potential for a sharp rally, in our view. Corn, soybeans and wheat may continue to drift sideways or lower, but the eventual upside risks are potentially explosive. Our graphic depicts the extreme narrowing wedge pattern of the Bloomberg Grains Spot Subindex, hovering at trend-line support with stocks-to-use and the Brazilian real-to-dollar exchange rate at multiyear highs. Our analysis of the average of corn, soybeans and wheat stocks-to-use from the USDA is the highest since 1989 on a quarterly basis, led by the beans.

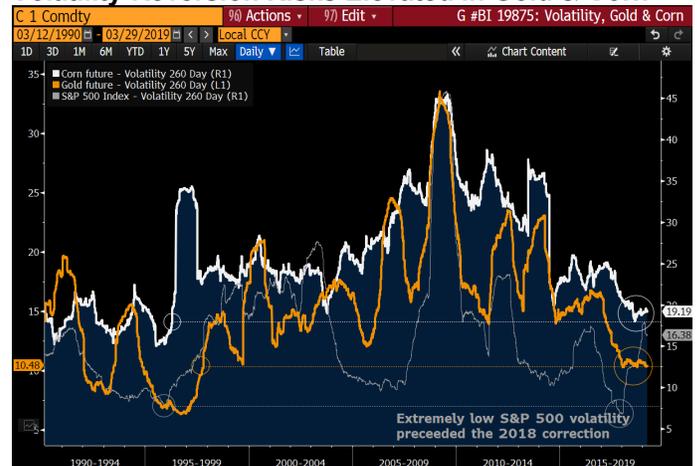

Grains Are Ripening to Breach Resistance

Multiyear highs in the trade-weighted broad dollar near the end of 2018 were likely a last gasp. Mean reversion in

the dollar and stocks should have an outsized benefit, boosting the grain index above 20-quarter resistance. **Explosion Risks Elevated in Gold and Corn.** Market volatility can stay low for extended periods but eventually reach such an extreme level of complacency that minor catalysts can spark big moves, and gold and corn are prime candidates. Our graphic depicts the lowest-for-longest 260-day volatility since 1997 for gold and 1996 for corn. Similar conditions for the S&P 500 at the beginning of 2018 resulted in the most significant correction (20%) in seven years. In 2017, the narrowest natural gas annual range since futures began trading in 1989 led to a 41% spike in November 2018.

Volatility-Reversion Risks Elevated in Gold & Corn

These sharp negative gamma-related moves from 2018 have fully reversed, after flushing plenty of weak positions. Traders, options positions and algorithms can become complacent selling rallies and calls, as in natural gas, or puts, as in equities, in low- and declining-volatility environments.

Shorts Indicate \$4.00 Corn

Hedge Funds Set to Pop Corn Toward \$4.40 Resistance From 2016. Record net shorts in corn is a foundation sufficient to revisit resistance near \$4.40, in our view. Farmers are due to prevail vs. record short hedge funds that are apparently positioned for virtually no weather premium. A primary negative gamma-risk market this year, corn's upside potential exceeds downside risks with stocks-to-use in decline.

Elevated Short-Covering Risks Should Lift Corn. Corn is ripe to revisit resistance levels last traded in 2015-16, near \$4.40 a bushel, in our view. Spring prices are higher than they were then, with managed money net positions the most short in the database (2006) and stocks-to-use in decline. Pricing in some summer weather-risk premium should be enough to revisit \$4 in the front contract, vs.

Bloomberg Commodity Outlook – April 2019 Edition

Bloomberg Commodity Index (BCOM)

\$3.79 on March 25. Declining stocks indicate that a bit of normalization in favorable weather and production trends should be sufficient to sustain above \$4.40.

Record Corn Shorts Support Revisiting Resistance

Corn planted acres are expected to increase this year in the Corn Belt -- hedge funds appear positioned for a lot more. The narrowest 24-month Bollinger Bands in five decades indicate plenty of trend fuel. Corn for December delivery is near \$4. Our indications favor it heading toward \$5 vs. \$3.

Corn Gamma Sellers Benefit Until They Don't. Gamma sellers in corn are overdue to get stopped out, potentially in a fashion similar to natural gas last year. Sellers of calls on rallies and puts on declines have prospered for five years. The narrowest 24-month Bollinger Bands since 1965 indicate the short-options sellers' party is about as good as it gets. Risks of a sharp move in corn are historically high; up is the path of least resistance. Typically, when markets get this compressed, it indicates complacent positions that take only a small spark to move sharply, the way normal winter cold did for gas in November.

Corn Ripe to Move; Tank as Full as It Gets

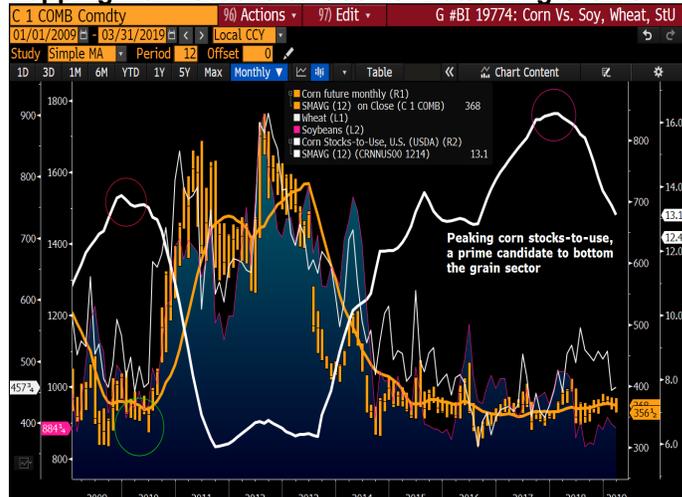

Gamma is the rate of change of delta, which is the underlying position in the market from an option. Short call strategies have been profitable since the price peak in 2012. We believe shorts are at greater risk of getting stopped out than longs.

Peaking Corn Stocks-to-Use to Mark Grain Bottom.

The most significant potential peak in corn stocks-to-use in almost a decade should mark a grain-price bottom, in our view. It's been since 2009 that USDA estimates of U.S. corn stockpiles declined at a velocity similar to 2018. It may be more significant that the peak in the primary negatively correlated price measure comes despite another year of record yields. An inflection point of demand surpassing supply is the indication. More planted acres are expected, but may be insufficient to end the bullish indication for prices in declining stocks-to-use.

Topping Corn Stocks-to-Use vs. Bottoming Grains

A handout at the All Day Ag Outlook highlighted the distinction -- soybean stocks-to-use are the highest in the 20-year data set vs. corn, which is at the lowest in four years. The USDA corn yield per harvested acre estimate of 179 bushels in 2018 is the greatest ever.

PERFORMANCE DRIVERS

Strong Livestock Set to Trickle Up to Broad Ags. Lean hogs are an early indicator of the broader agriculture market's reversion potential to a higher mean. Up about 34% in 2019, lean-hog futures are second only to unleaded gas on this year's commodity leader board, yet remain below the halfway mark of the 2014-16 range. Back toward unchanged vs. the end of 2014, hogs have simply recovered lost ground.

Bloomberg Commodity Outlook – April 2019 Edition

Bloomberg Commodity Index (BCOM)

Swine Flu in China, Not Trade, Boosts Livestock

Security	Chg YTD %	Chg March	Chg QTD Pct	1Yr % Chg	2Yr % Chg
Bloomberg Lean Hogs Subindex T	+6.8%	+23.7%	+6.6%	+6.5%	5.1%

Bloomberg Grains Subindex Tota	-5.8%	-2.6%	-5.8%	-16.9%	-19.9%
Bloomberg Corn Subindex Total	-6.3%	-3.7%	-6.3%	-17.8%	-22.7%
Bloomberg Wheat Subindex Total	-9.0%	-2%	-9.0%	-8.7%	-19.0%
Bloomberg Coffee Subindex Tota	-9.5%	-3.8%	-9.5%	-28.0%	-44.2%
Bloomberg Kansas Wheat Subinde	-12.6%	-3.1%	-12.6%	-20.4%	-26.4%

Last year's top agriculture performer, wheat, has succumbed to some back-and-fill. It's likely to revisit the upper end of its recovery range, near \$5.50 a bushel in Chicago wheat, in our view. Entering the prime Corn Belt growing season should keep the grains in the ag-sector driver's seat, set for recovery on the back of reversion from 2018's near-perfect storm for lower prices.

BLOOMBERG INTELLIGENCE: COMMODITY DASHBOARDS

BI <GO> * Click hyperlinks to open in Bloomberg

BI provides analysis on several key drivers of BCOM performance; industrial and precious metals mining, oil and natural gas production, and agricultural chemicals. The dashboards include key macro data libraries and interactive charting and commentary from analysts with an average of seventeen years of experience.

Crude Oil Production: BI OILS <GO>

	2015	2014	2013	2012	2011
Demand (MMBOPD)
